Routine checking of common safety issues and team communication could improve patient safety and perioperative morbidity/mortality.

Using a surgical checklist makes medical professionals pause and go through each aspect of the time out prior to proceeding with the procedure.

Time outs focus on the patient’s individual case and helps prevent medical errors.

Surgical checklists have been shown to improve patient safety, reduce near misses, and increase patient satisfaction.

Increasing RN/Physician time out compliance by providing education to staff and having a paper checklist available as a reminder to actively do the time out properly.

Administered anonymous paper pre-surveys to RN’s 1 week prior implementation of educational flyers and paper checklists.

Educational flyers posted on the nursing unit and paper checklists placed on invasive procedure carts for 1 week.

Anonymous post-surveys were administered after 1 week of educational flyers and paper checklists in circulation.

Does Implementing a Paper Time-Out Sheet Improve RN/Physician Compliance with Pre-Procedure Time-Out Prior to Invasive Bedside Procedures?

Cassie Campbell, BSN, RN, Hannah Cloutier, BSN, RN, Fara D’Angelo, BSN, RN, Sarah Yanulis, BSN, RN

Background

- Routine checking of common safety issues and team communication could improve patient safety and perioperative morbidity/mortality.
- Using a surgical checklist makes medical professionals pause and go through each aspect of the time out prior to proceeding with the procedure.
- Time outs focus on the patient’s individual case and helps prevent medical errors.
- Surgical checklists have been shown to improve patient safety, reduce near misses, and increase patient satisfaction.

Practice Change

Increasing RN/Physician time out compliance by providing education to staff and having a paper checklist available as a reminder to actively do the time out properly.

Methods

- Administered anonymous paper pre-surveys to RN’s 1 week prior implementation of educational flyers and paper checklists.
- Educational flyers posted on the nursing unit and paper checklists placed on invasive procedure carts for 1 week.
- Anonymous post-surveys were administered after 1 week of educational flyers and paper checklists in circulation

Measures and Results

Pre Survey (n=31)

Has a Time Out been done before every invasive procedure that you have participated in?
- Yes: 77% No: 23%

Are Time Outs usually documented in real time in the Electronic Medical Record?
- Yes: 29% No: 71%

Do you think a visual aid will help increase the compliance of Time Outs during invasive procedures?
- Yes: 80% No: 16% Unsure: 3%

Do you feel like you understand your role in a Time Out?
- Yes:100%

Post Survey (n=12)

Do you think Time Out compliance has improved since implementing a visual aid reminder?
- Yes: 66% No: 16% Had not done a time out with change in place: 16%

Do you think the use of this Visual Aid is beneficial when documenting the Time Out?
- Yes: 77% No: 23%

Do you better understand your role in a Time Out after the implementation of the visual aid?
- Yes: 66% No: 8% No answer: 25%

Summary/Discussion

This work was a preliminary investigation focused on methods to increase Time Out compliance. Moving forward, several areas require further analysis. Future efforts should include:
- Providing more education for a longer period of time.
- Providing more awareness to the issue and the change needed.
- Exploring other methodologies to improve compliance from staff.

Feedback:
“IT’s not realistic to documented in real time in patient room when usually only 3 staff and both sterile for procedure”

“Having a visual aid placed on the line and circumcision cart was helpful as a reminder and sequence when implementing Time Out”

Conclusion

- This project proved to be inconclusive. Further studies need to be completed and increased participation are required to determine the effectiveness of these measures.
- There was a mix of opinions on the idea of a paper visual aid used during a Time Out from the staff of NICU, L&D, and ICU. Some staff found the visual aid helpful, whereas others felt it was too much task duplication.
